Golden shiner	Pumpkinseed sunfish
Redbelly dace	

Physical Characteristics

Area - 77 acres	Temperatures
	Surface - 83°F
Maximum depth - 9 feet	9 feet - 57°F

Principal fisheries: Largemouth bass,
chain pickerel

An old mill dam in the village of Morrill forms Smiths Mill Pond. This is a shallow, weedy flowage surrounded by farmland, woodland, and marsh. An unimproved landing suitable for launching canoes and small boats is located at the outlet near Route 131.

Smiths Mill Pond is well suited for warmwater fish management. Largemouth bass were recently introduced by Department biologists. Chain pickerel are also present and provide summer and winter fishing opportunity.

Anglers are urged to assist the Department in evaluating the recent bass introduction by reporting their catches

to the regional fisheries biologist or local Game Warden. Reports should be submitted to: Regional Headquarters, RFD #1, Box 6378, Waterville, ME, 04901 (phone - 547-4161).

Surveyed - August, 1979
(Revised - 1992) Maine Department of Inland Fisheries and Wildlife. Funded in part by Federal Aid in Fish Restoration Act under Federal Project F-28-P.
